AB The title method comprises: (1) steam-blasting straws with water content of 10-35% under steam pressure of 1.0-1.5 MPa for 2-7 min, (2) washing with water of 50-100°C, drying, mixing with ionic liquid at a solid-liquid ratio of 1 : (5-50), and heating directly or by microwave under stirring for 5-60 min, (3) washing the treated straw with water, and (4) hydrolyzing with cellulase at below 50°C and pH 4.8 for 48-72 h. The aforementioned ionic liquid contains cations selected from N,N-dimethylimidazole ion, 1-ethyl-3-methylimidazole ion, 1-allyl-3-methylimidazole ion, 1-butyl-3-methylimidazole ion and 1-methyl-3-butylimidazole ion, and anions selected from chloride ion, bromide ion, acetate ion and thiocyanate ion. The method can be used to obtain enzymic hydrolysis rate of cellulose up to 100%.

AB An organic starch ester is prepared by mixing a starch material, such as natural starch or hydrolyzed starch, with an ionic liquid solvent to dissolve the starch, and then treating the dissolved starch with an organic esterifying agent, such as C1-11 carboxylic acid, to form an organic starch ester, and subsequently separating the organic starch ester from the solution by adding a non-solvent, such as alcs., ketones, and acetonitrile, to the starch ester solution Microwave irradiation and/or pressure can be applied to assist the dissoln. and esterification. Thus, native barely starch was dissolved in ionic 1-butyl-3-methylimidazolium chloride and reacted with acetic anhydride, followed by quenching with ethanol to receive starch acetate.

AB High-amylose starch can dissolve effectively in a room temperature
ionic liquid 1-allyl-3-methylimidazolium chloride
(amimCl). By using amimCl as the reaction medium, high-amylose
starch acetates with a relatively wide range of degree
of substitution (DS) were homogeneously synthesized by a one-step method
in the absence of any catalyst. The effects of reaction time and acetic
anhydride/anhydroglucose unit (AGU) molar ratio on the DS of
starch acetates were investigated. These starch
acetates exhibited different solubility in water, acetone and DMAc,
depending on the DS value. Finally, the fibrous membranes composing of
continuous and smooth fibers with diams. in a range from several tens to
several hundreds nanometers were successfully produced via electrospinning
of starch acetate solution

AB Degraded cellulose is prepared by dissolving cellulose in an ionic liquid and treating it at elevated temps., optionally in the presence of water. Thus, dried cellulose 0.5 g was dissolved in 1-ethyl-3-methylimidazolium hydrogensulfate 20.0 g at 120°, then reacted with water by adding 0.05 g water into the solution for 16 h at 100° to give degraded cellulose showing no precipitation was formed when the resultant mixture was poured into 20 times water or methanol.

AB The title composition comprising 1 - 10 weight% water or protic solvents and 1 - 35 weight% carbohydrates can be used for regenerating cellulose, starch and other carbohydrates, in particular in the form of regenerated cellulose fibers. Thus, mixing 5 min at 50° 800 g

1-ethyl-3-methylimidazolium acetate and 100 g water, adding 100 g cellulose and tempering 45 min at 90° gave a solution, which can be used after filtering via 15 µm filter for manufacture fibers.

AB The title composition comprising ≥5 weight% water or protic solvents and 1 - 35 weight% carbohydrates can be used for regenerating cellulose, starch and other carbohydrates. Thus, mixing 5 min at 50° 800 g 1-ethyl-3-methylimidazolium acetate and 100 g water, adding 100 g cellulose and tempering 45 min at 90° gave a solution, which can be used after filtering via 15 µm filter for manufacture fibers.

AB Biopolymers such as starch and zein protein were found to be soluble at 80° in ionic liqs. such as 1-butyl-3-methylimidazolium chloride (BMIMCl) and 1-butyl-3-methylimidazolium dicyanamide (BMIMdca) in concns. up to 10% (weight/weight). Higher concns. of biopolymers in these novel solvents resulted in solns. with too high viscosity to stir. Solns. of both starch and zein in BMIMCl were acylated with anhydrides in presence of pyridine to give acetyl starch and benzoyl zein with various degrees of substitution. Without pyridine the acylation reaction did not proceed. 1H NMR and IR spectroscopies were used to determine the degree of substitution of starch. Viscosity studies indicated that the starch underwent slight reduction in mol. weight during the course of acylation. Starch was also soluble in other non-conventional solvents such as choline chloride/oxalic acid and choline chloride/ZnCl2. However, zein was insol. in these solvents.

AB The title method comprises: (1) steam-blasting straws with water content of 10-35% under steam pressure of 1.0-1.5 MPa for 2-7 min, (2) washing with water of 50-100°C, drying, mixing with ionic liquid at a solid-liquid ratio of 1 : (5-50), and heating directly or by microwave under stirring for 5-60 min, (3) washing the treated straw with water, and (4) hydrolyzing with cellulase at below 50°C and pH 4.8 for 48-72 h. The aforementioned ionic liquid contains cations selected from N,N-dimethylimidazole ion, 1-ethyl-3-methylimidazole ion, 1-allyl-3-methylimidazole ion, 1-butyl-3-methylimidazole ion and 1-methyl-3-butylimidazole ion, and anions selected from chloride ion, bromide ion, acetate ion and thiocyanate ion. The method can be used to obtain enzymic hydrolysis rate of cellulose up to 100%.

AB We have found that biopolymers, such as starch and zein, are soluble in ionic liquid 1-butyl-3-methylimidazolium chloride up to 15% (weight/weight) concentration at 80 -aC. The starch solution reacted with acetic anhydride and pyridine to give acetylated starch with DS of 0.3 to 2.6 in good yields. Similarly, zein solution reacted with benzoyl anhydride and pyridine to give benzoate ester. In this work, we have demonstrated for the first time that IL could be used as a solvent for the chemical modifications of starch and zein.

AB An organic starch ester is prepared by mixing a starch material, such as natural starch or hydrolyzed starch, with an ionic liquid solvent to dissolve the starch, and then treating the dissolved starch with an organic esterifying agent, such as C1-11 carboxylic acid, to form an organic starch ester, and subsequently separating the organic starch ester from the solution by adding a non-solvent, such as alcs., ketones, and acetonitrile, to the starch ester solution. Microwave irradiation and/or pressure can be applied to assist the dissoln. and esterification. Thus, native barely starch was dissolved in ionic 1-butyl-3-methylimidazolium chloride and reacted with acetic anhydride, followed by quenching with ethanol to receive starch acetate.

AB This invention relates to novel pharmaceutical compns. for delivery of biol. active mols., such as polypeptides, drugs and other therapeutic agents, across various biol. barriers mixing one or more effectors (anionic impermeable mols.) with a counter ion to the effector (a liquid forming cation). The invention also relates to methods of treating or preventing diseases by administering pharmaceutical compns. to affected subjects. For example, an ionic liquid forming cation was used to enable the translocation of insulin across an epithelial barrier. A composition containing recombinant human insulin and an ionic liquid forming cation, e.g., 1-butyl-3-methylimidazolium chloride, together with phytic acid, Pluronic F68, aprotinin, Solutol HS-15, and N-acetylcysteine was administered rectally or by injection into an intestinal loop of a test animal, e.g., a mouse. Blood glucose levels decrease in relation to the amount of insulin absorbed from the intestine into the bloodstream (i.e., in an amount that correlates to the amount of insulin absorbed). Thus, this drug delivery system can replace the need for insulin injections, thereby providing an efficient, safe and convenient route of administration for diabetes patients.

AB The invention relates to liquid compns. intended for formation of prolonged-release capsules. The prolonged release of the drug is achieved by in situ formation of a matrix, which being compact and biodegradable, is obtained by instantaneous phys. modification of the contents of the capsule in contact with the gastric juices. Thus, slow-release soft capsules contained dimenhydrinate 50.0000g, Transcutol P 425.0000, Sepiegel-305 400.0000 and sucrose acetate isobutyrate 25.0000 g.

AB The title compds. (I; n = 1-6' R1 = H, C1-4 alkyl; R2 = C1-12 alkyl; A = anion) are prepared Also described are an ionic liquid consisting of an imidazolium salt derived from the N-alkoxyalkylimidazolium cation of I and a counter anion and an ionic gel obtained by dissolving synthetic polymer, protein, polysaccharide, carbohydrate derivative, or mol. aggregate in the ionic liquid These imidazolium salts provides ionic lig at room temperature without ion exchange and possess high solubilization power against many synthetic polymers, biopolymers, or mol. aggregates. The ionic liquid is used for solid electrolyte materials, electrochem. materials, and biocatalytic materials and useful as a soluble support or reaction solvent, extraction solvent for synthetic reaction, or organic electrolyte, or for development of functional gel furnished with biomol. functions such as specific mol. recognition and catalysis (no data). It can solubilize above substances hitherto incompatible with existing ionic liquid and has low viscosity which is a desirable characteristic as reaction medium for easy dispersion of reactants. When used as reaction medium, it is used for enzymic modification of biochem. substances such as proteins or sugars or modification of biopolymers such as proteins, sugars, or polysaccharides using water-unstable modifying agents such as acid halides or acid anhydrides. Thereby, it provides method for rapid, simple, and inexpensive chemical modification of sugars or polysaccharides since it solubilizes them without using protecting groups. Thus, 17.9 g 2-bromoethyl Me ether was slowly added dropwise to 10.6 g 1-methylimidazole and heated to 60° with stirring to give a brown viscous solution which was successively washed with acetone and Et acetate followed by completely distilling out these solvent under reduced pressure. The obtained liquid was purified by a column of alumina to give 61% N-methyl-N'-methoxyethylimidazolium bromide (II) which was a liquid at room temperature and had d. of 1.39 g/cm³ and viscosity of 162 cP. II solubilized urea, pentaerythritol, β -D-glucose, α -cyclodextrin, agarose, and glucose oxidase.

AB Starch ethers are prepared by mixing starch with an ionic liquid solvent to dissolve the starch, and then treating the dissolved starch with an etherifying agent in the presence of a base to form a starch ether, and subsequently separating the starch ether from the solution, wherein both the dissoln. and the etherification are carried out in the substantial absence of water.

AB The invention relates to a composite material based on water-insol. polysaccharide, such as cellulose and chitin. The composite material comprises particles of at least one light scattering material, the surface of which is essentially covered with at least one water-insol. polysaccharide. The invention also relates to a method for preparation of the composite material, and to a paper and board manufacturing process in which the composite material is used as a filler or pigment. Both highly organic products with exceptional heat capacities, as well as cheap high filler products can be manufactured. The composite material significantly improves retention of light scattering fillers in the manufacture of paper and board even without the use of sep. retention aids.

AB Starch dissolved in an ionic liquid can be depolymd. without acid or base catalyst or enzyme. Starch is selectively depolymd. by mixing with an ionic liquid solvent to dissolve the starch, and then treating the dissolved starch by agitating at elevated temperature and for a period for time to effect depolymn. of the starch into desired depolymn. products. For example, all the starch was depolymd. into monomeric products by stirring a mixture of 150 mg of oven-dried native barley starch with 3 mL 1-butyl-3-methylimidazolium chloride solvent for 30 min at 85° and 2h at 150°. Stirring a similar mixture for

30 min at 85° and 2h at 100° gave a product mixture containing monomeric products of depolymd. amylose but amylopectin remained intact (GPC).

AB Cellulose is mixed and dissolved in an ionic liquid solvent and the solution is treated with an etherifying agent in the presence of inorg. base to form a cellulose ether, which is subsequently separated from the solution. The dissoln. and the etherification are carried out in the absence of organic base and in the substantial absence of H₂O. Microwave irradiation and/or pressure can be applied to assist in dissoln. and etherification. Thus, 50 mg cellulose was dissolved in 5 g 1-butyl-3-methylimidazolium chloride (m. 60°) with the aid of microwaves to give 1% solution. ClCH₂CO₂H (2.05 equiv) was added to the solution followed by 3.25 equiv of solid NaOH, the reaction mixture was heated for 2 h at 100° under microwave radiation and the resulting CM-cellulose was precipitated with MeOH, washed with MeOH and 80% aqueous MeOH, and dried.

AB An organic starch ester is prepared by mixing a starch material, such as natural starch or hydrolyzed starch, with an ionic liquid solvent to dissolve the starch, and then treating the dissolved starch with an organic esterifying agent, such as C1-11 carboxylic acid, to form an organic starch ester, and subsequently separating the organic starch ester from the solution by adding a non-solvent, such as alcs., ketones, and acetonitrile, to the starch ester solution. Microwave irradiation and/or pressure can be applied to assist the dissoln. and esterification. Thus, native barely starch was dissolved in ionic 1-butyl-3-methylimidazolium chloride and reacted with acetic anhydride, followed by quenching with ethanol to receive starch acetate.

AB Wood, straw, and other natural lignocellulosic materials can be dissolved in an ionic liquid solvent under microwave irradiation and/or under pressure, and cellulose and other organic compds., such as lignin and extractives, can also be separated from the solution by precipitating with non-solvent, such as water, alcs., ketones, and ethers, of cellulose. Thus, plywood sawdust was dissolved in 1-butyl-3-methyl-imidazolium chloride under microwave irradiation
